Benzodiazepines like [Buy Xanax Online](#) are central nervous system depressants that slow down brain activity and relax the muscles. They achieve this by increasing the effects of GABA [gamma-aminobutyric acid]—one of the main calming or inhibiting neurotransmitters in the brain.

We all have dozens of neurotransmitters, or chemical messengers, that allow neurons to communicate with each other throughout the body, and the amino acid GABA is one of them. As the primary inhibitory neurotransmitter in the brain—meaning it makes neurons less likely to fire, or send a chemical message—GABA plays a role in several calming functions, including muscle relaxation, the reduction of brain activity and sleep regulation.

## What are the benefits of Xanax?

Xanax can be beneficial for people with anxiety or panic disorders.

Generalised anxiety disorder is characterised by excessive or unwarranted anxiety and worry for a period of at least six months. Panic disorder is described by recurrent unexpected periods of intense fear, also known as a panic attack.

During a panic attack, a person will usually have a pounding or racing heart, sweating, trembling, shortness of breath, a choking feeling, dizziness, fear, and other symptoms.

## **How Do I Take Xanax?**

The first dose during an afternoon or evening when being sleepy wouldn't be problematic. "It's best to be at home and avoid driving, especially early in the course as people learn. "For this reason it can become quite addictive. As the medicine's effects rapidly end, anxiety returns and some people are left wanting more," he says, advising patients to take as little as they can and to space out doses as much as possible.
